This report is presenting on the history and current financial state of a fictitious company I made up data for.

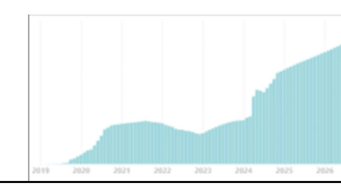
As per our product, I was inspired by Finviz, which I use for granular stock information (1-minute graphs, for example), so pretended I opened up a company to provide consulting and research work for big banks and family trusts, but also a Finviz style website with a monthly subscription.

In this report I:

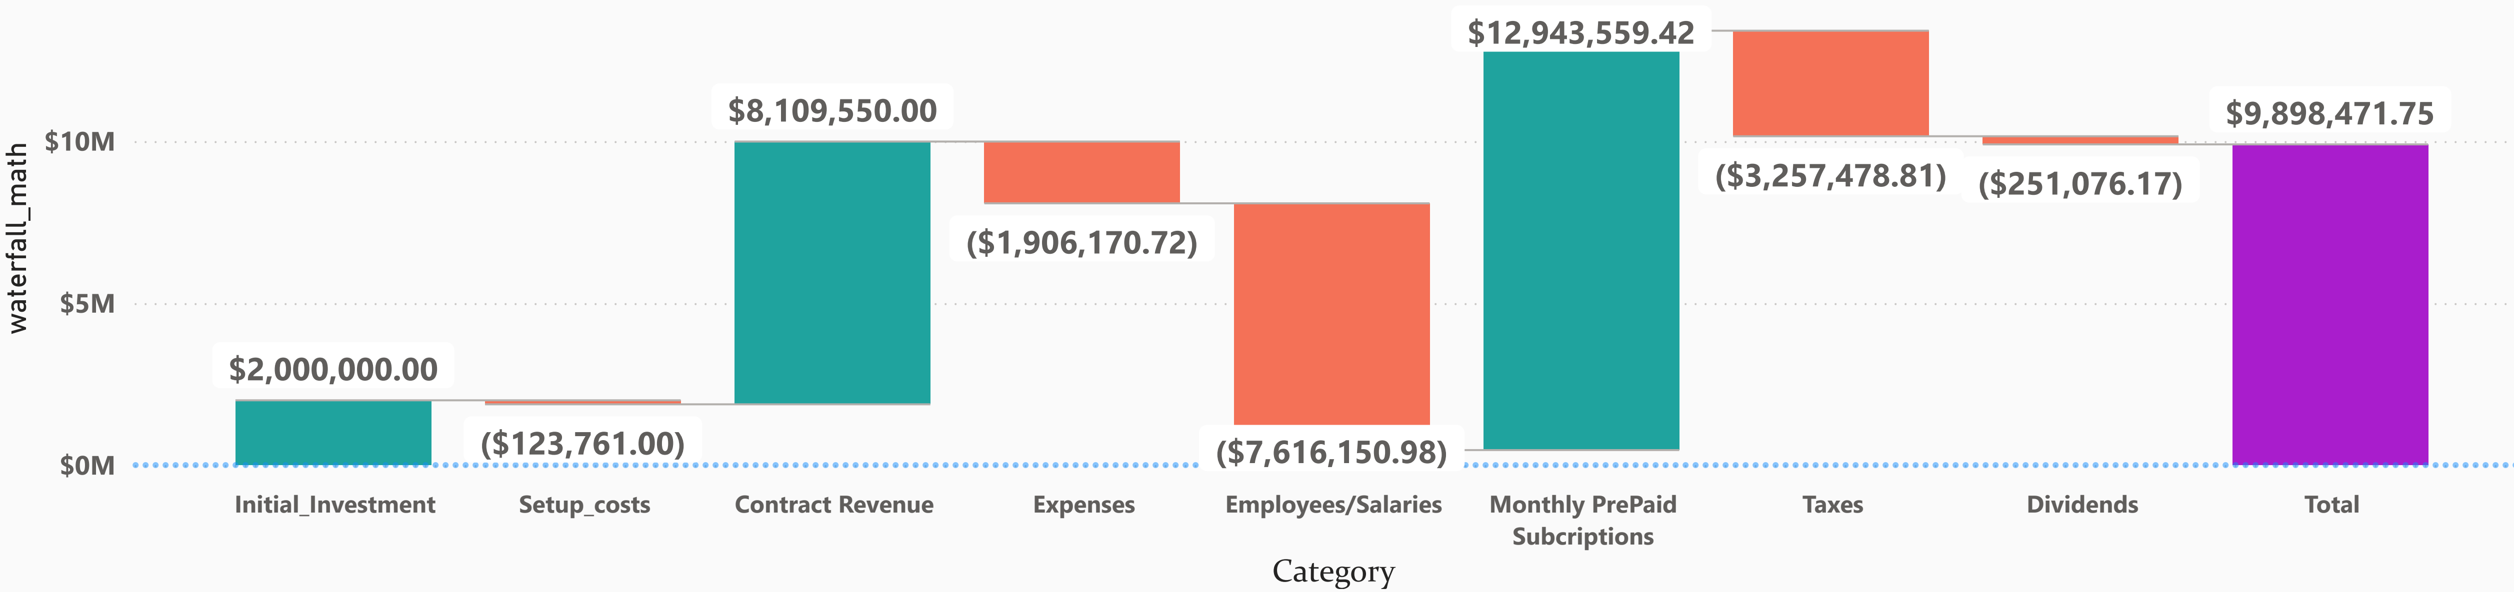
- Use DAX to categorize our financials into narrative buckets so we can chart them neatly as a waterfall or funnel
- Use DAX and some M to turn payment and billing files into running totals, a balance calculation, and ultimately, an aging report
- Calculate taxes and create an income statement by grouping data in calculated tables behind the scenes

What a Viewer Should Experience:

- You should easily grasp the growth stages we've been through
- See that we started with one product line, then started a second, and that the second exploded, in a good way!
- Understand our current financial situation: there is cash on hand, which is great, but also potentially some minor debt issues
- Get some Accounting stats such as margin and net profit, as well as a feel for our churn rate
- The DAX and how the data flowed before it got into a simple (and hopefully pretty) chart. I have some Dax samples towards the end of this presentation, since you're probably viewing a PDF, not PBIX file

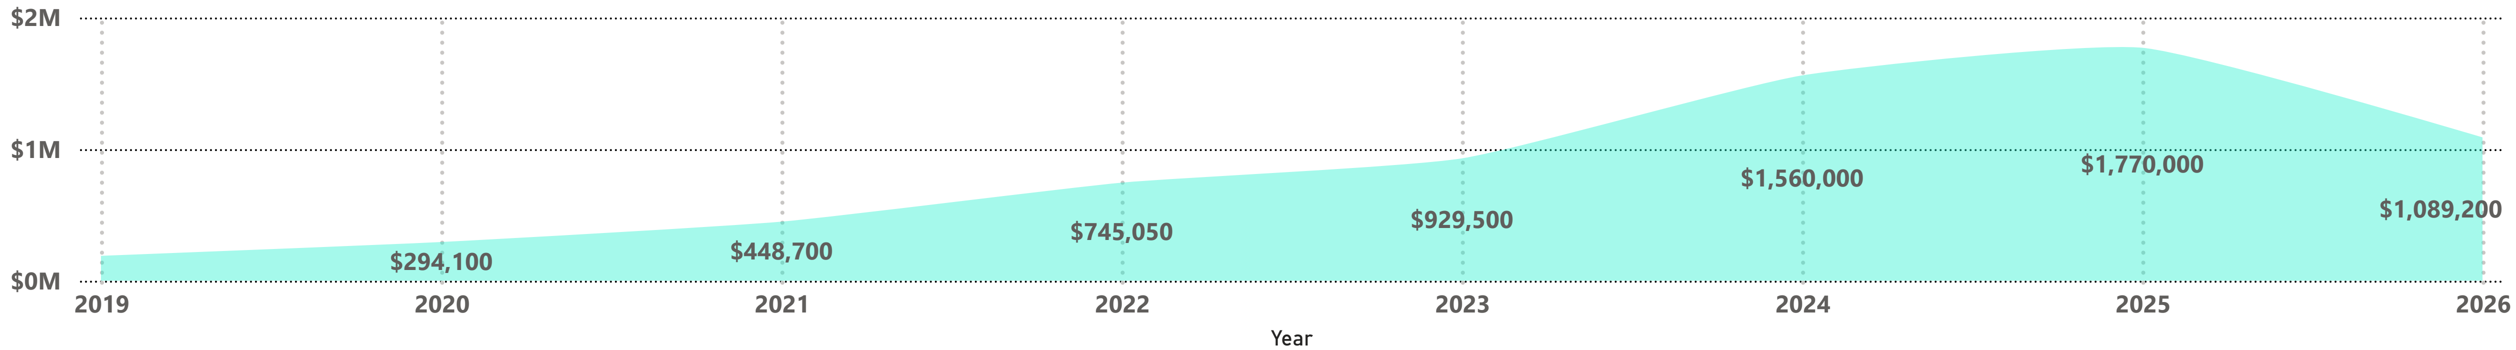


"Waterfall" Chart / Financial Snapshot of Entire History

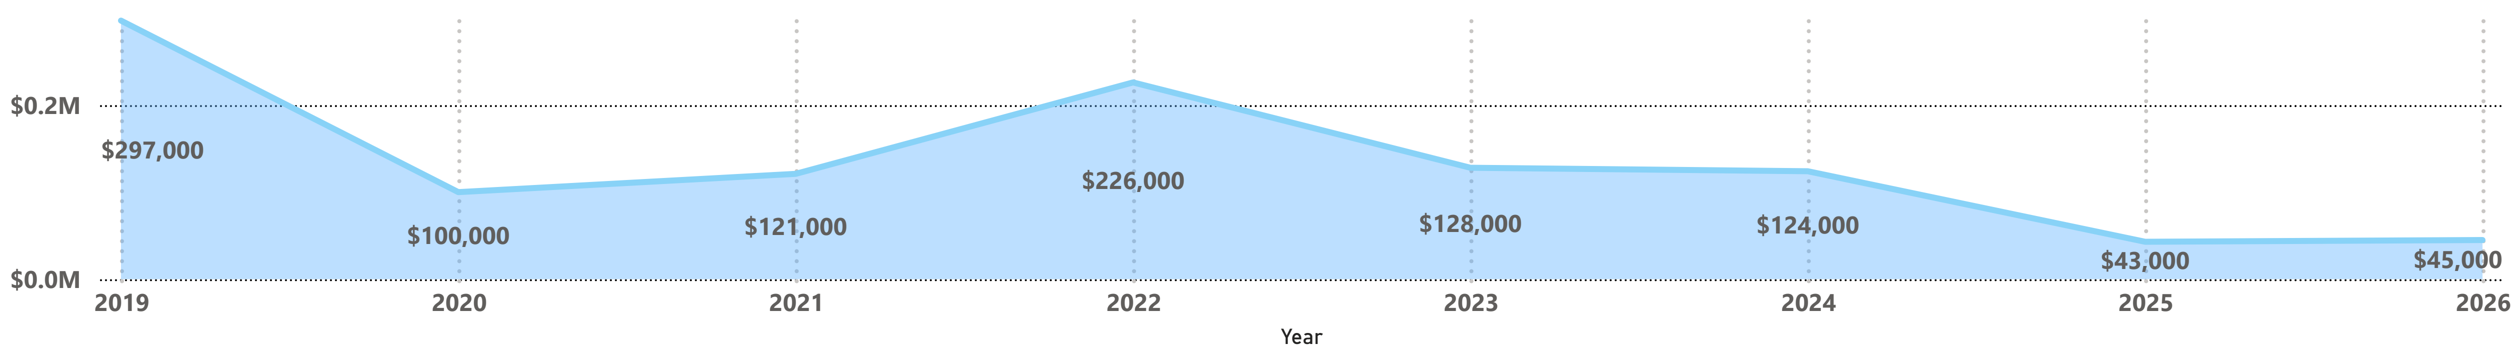


Net Income Growth by Unofficial Growth Phase

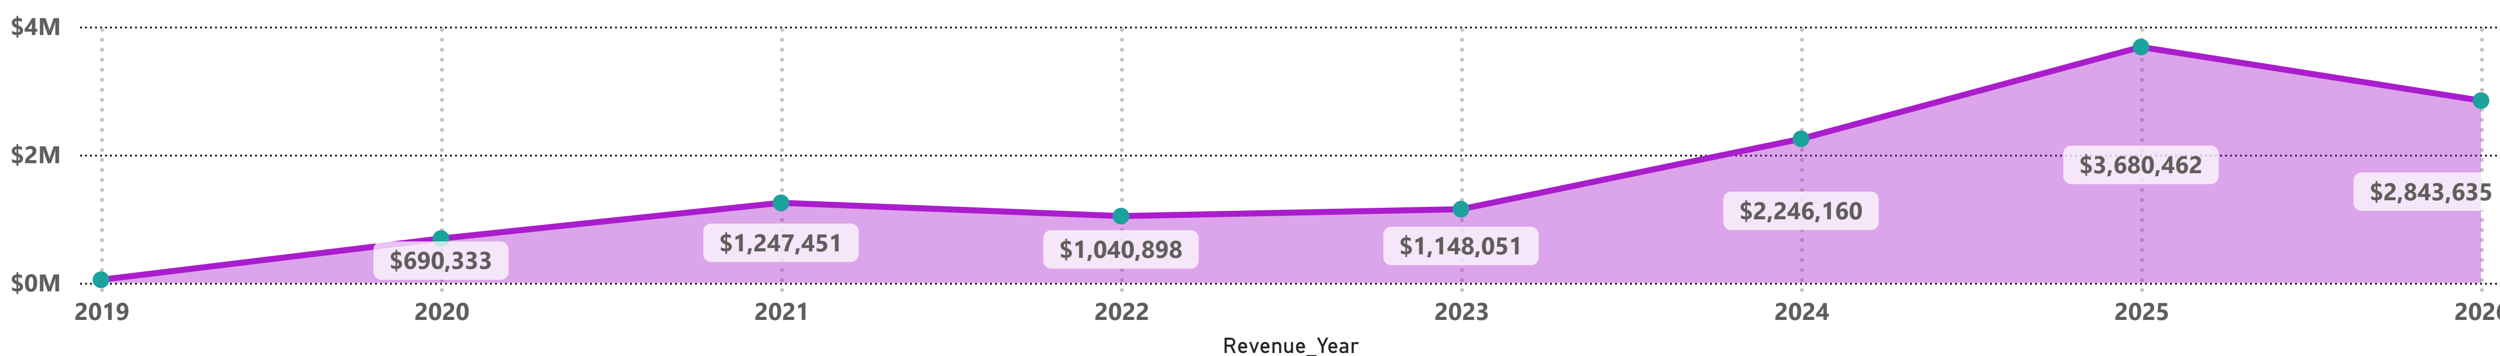
Recurring Revenue, Large Contracts & Consulting, including One-Time Charges

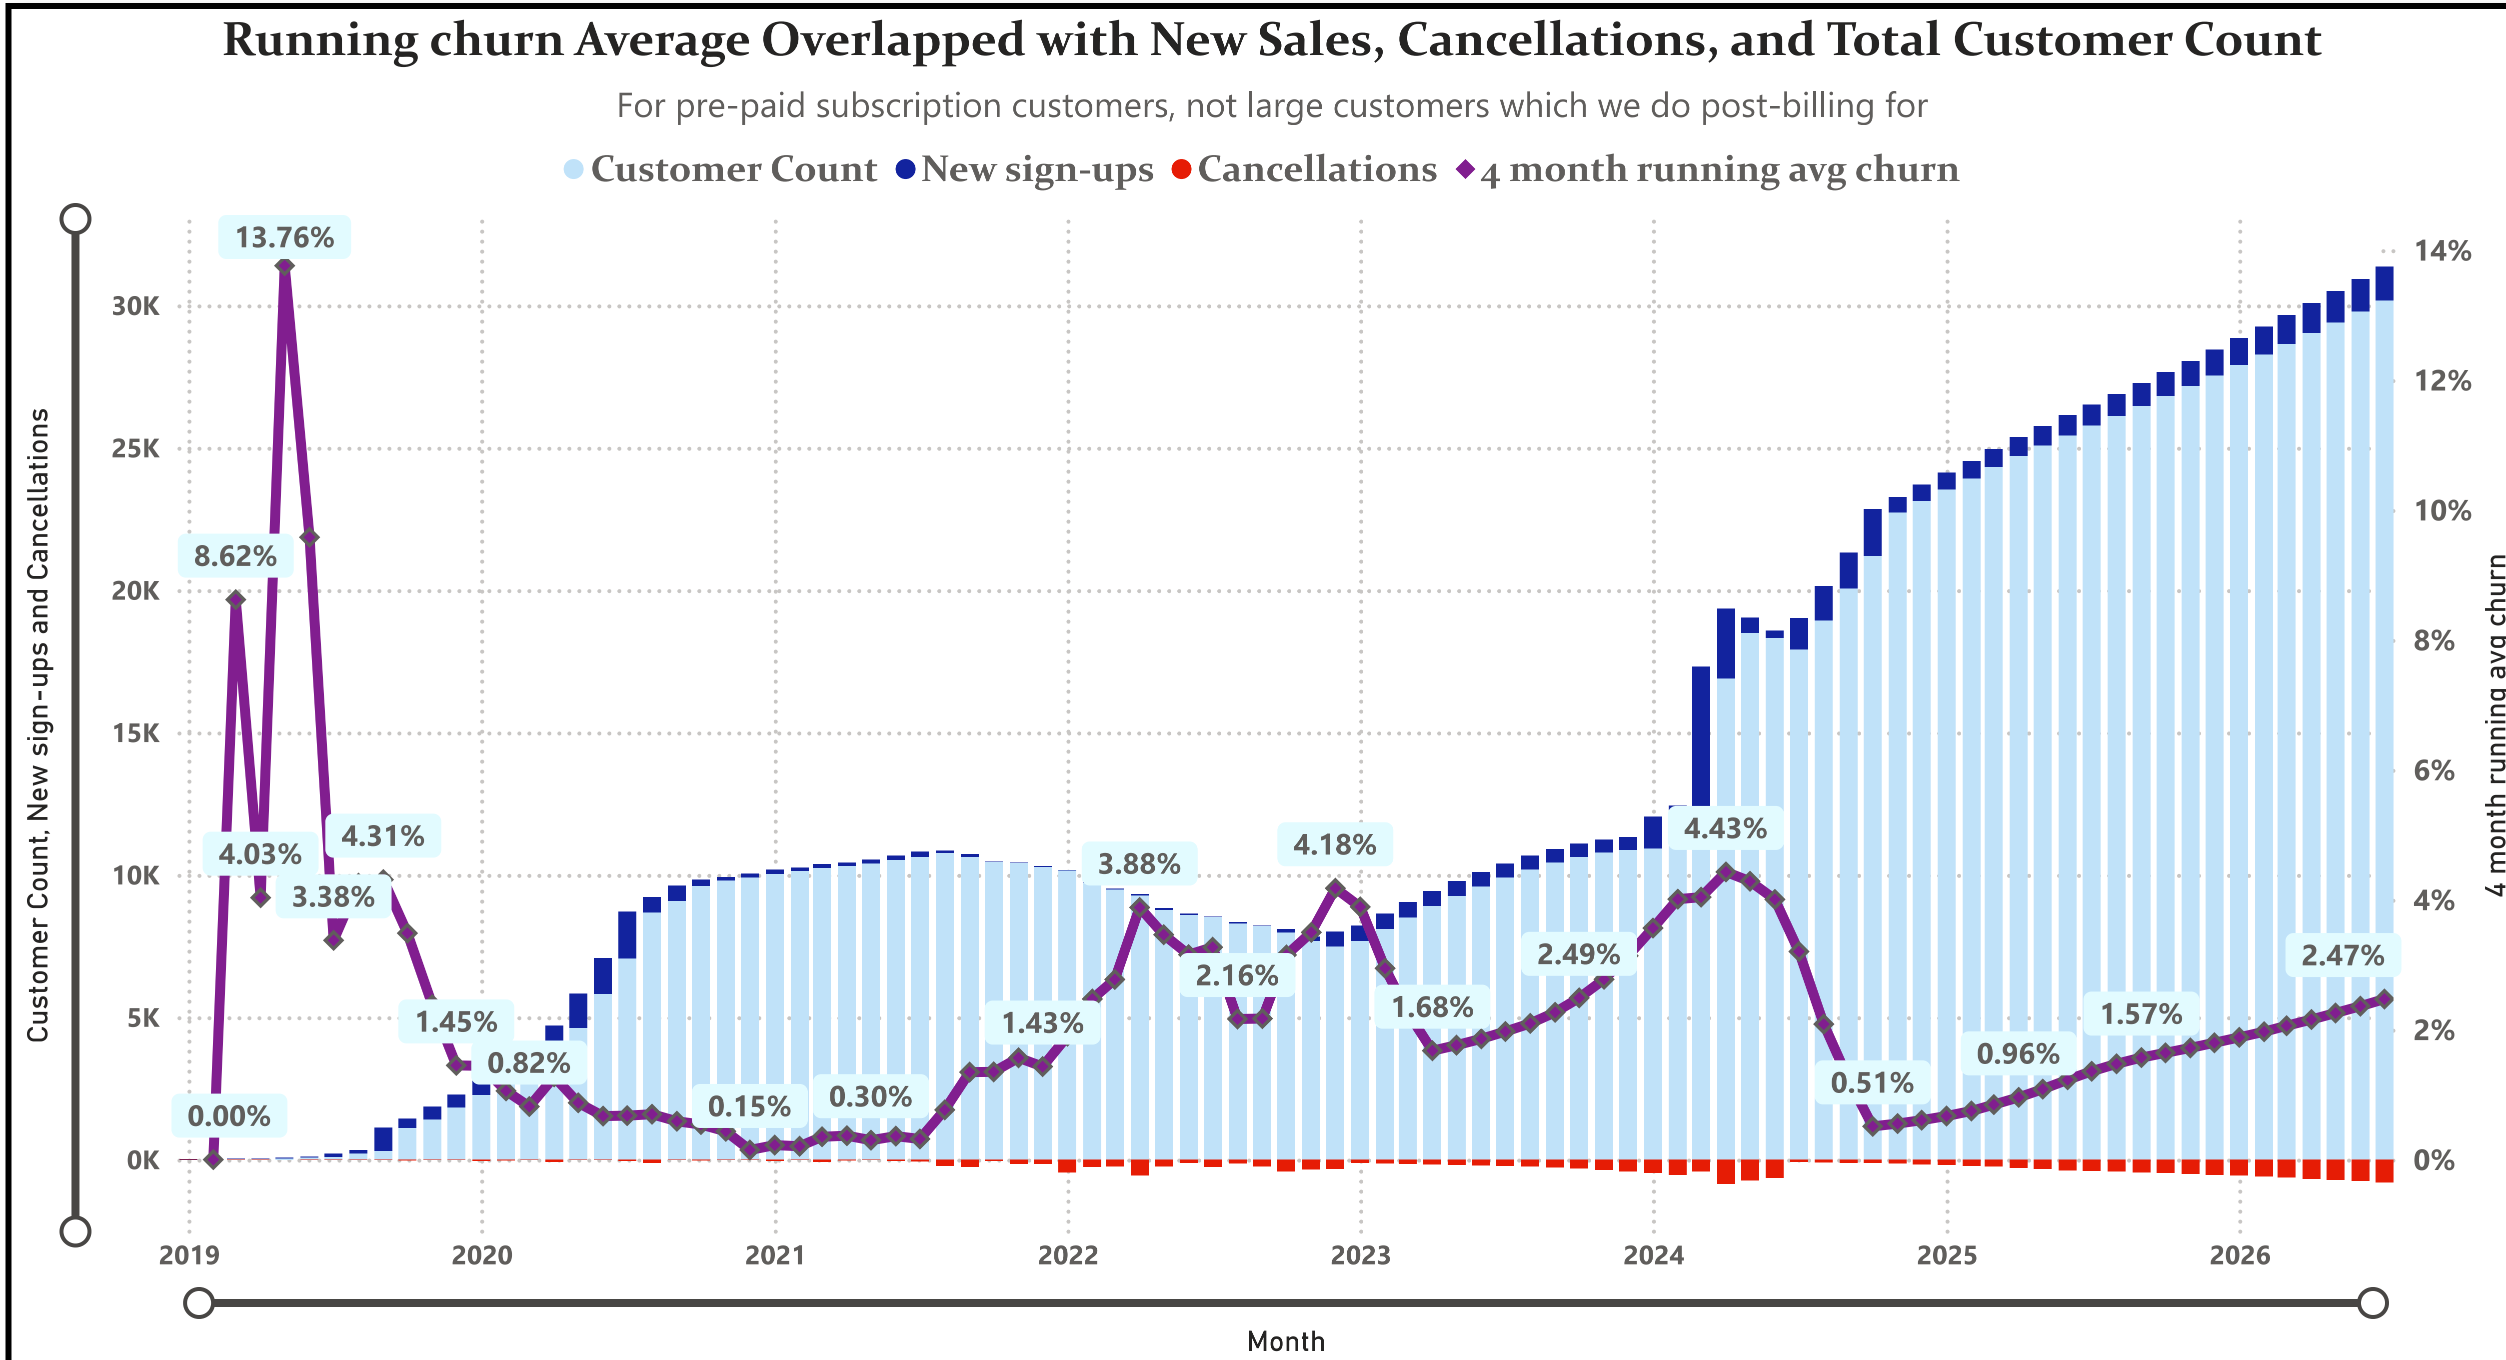


One-Time Revenue (ex. Extra Research, Software Setup, etc.) Isolated (Inc. in above amounts)



Pre-Paid Subscription Revenue





Running churn Average Overlapped with New Sales, Cancellations, and Total Customer Count
For pre-paid subscription customers, not large customers which we do post-billing for
Customer Count

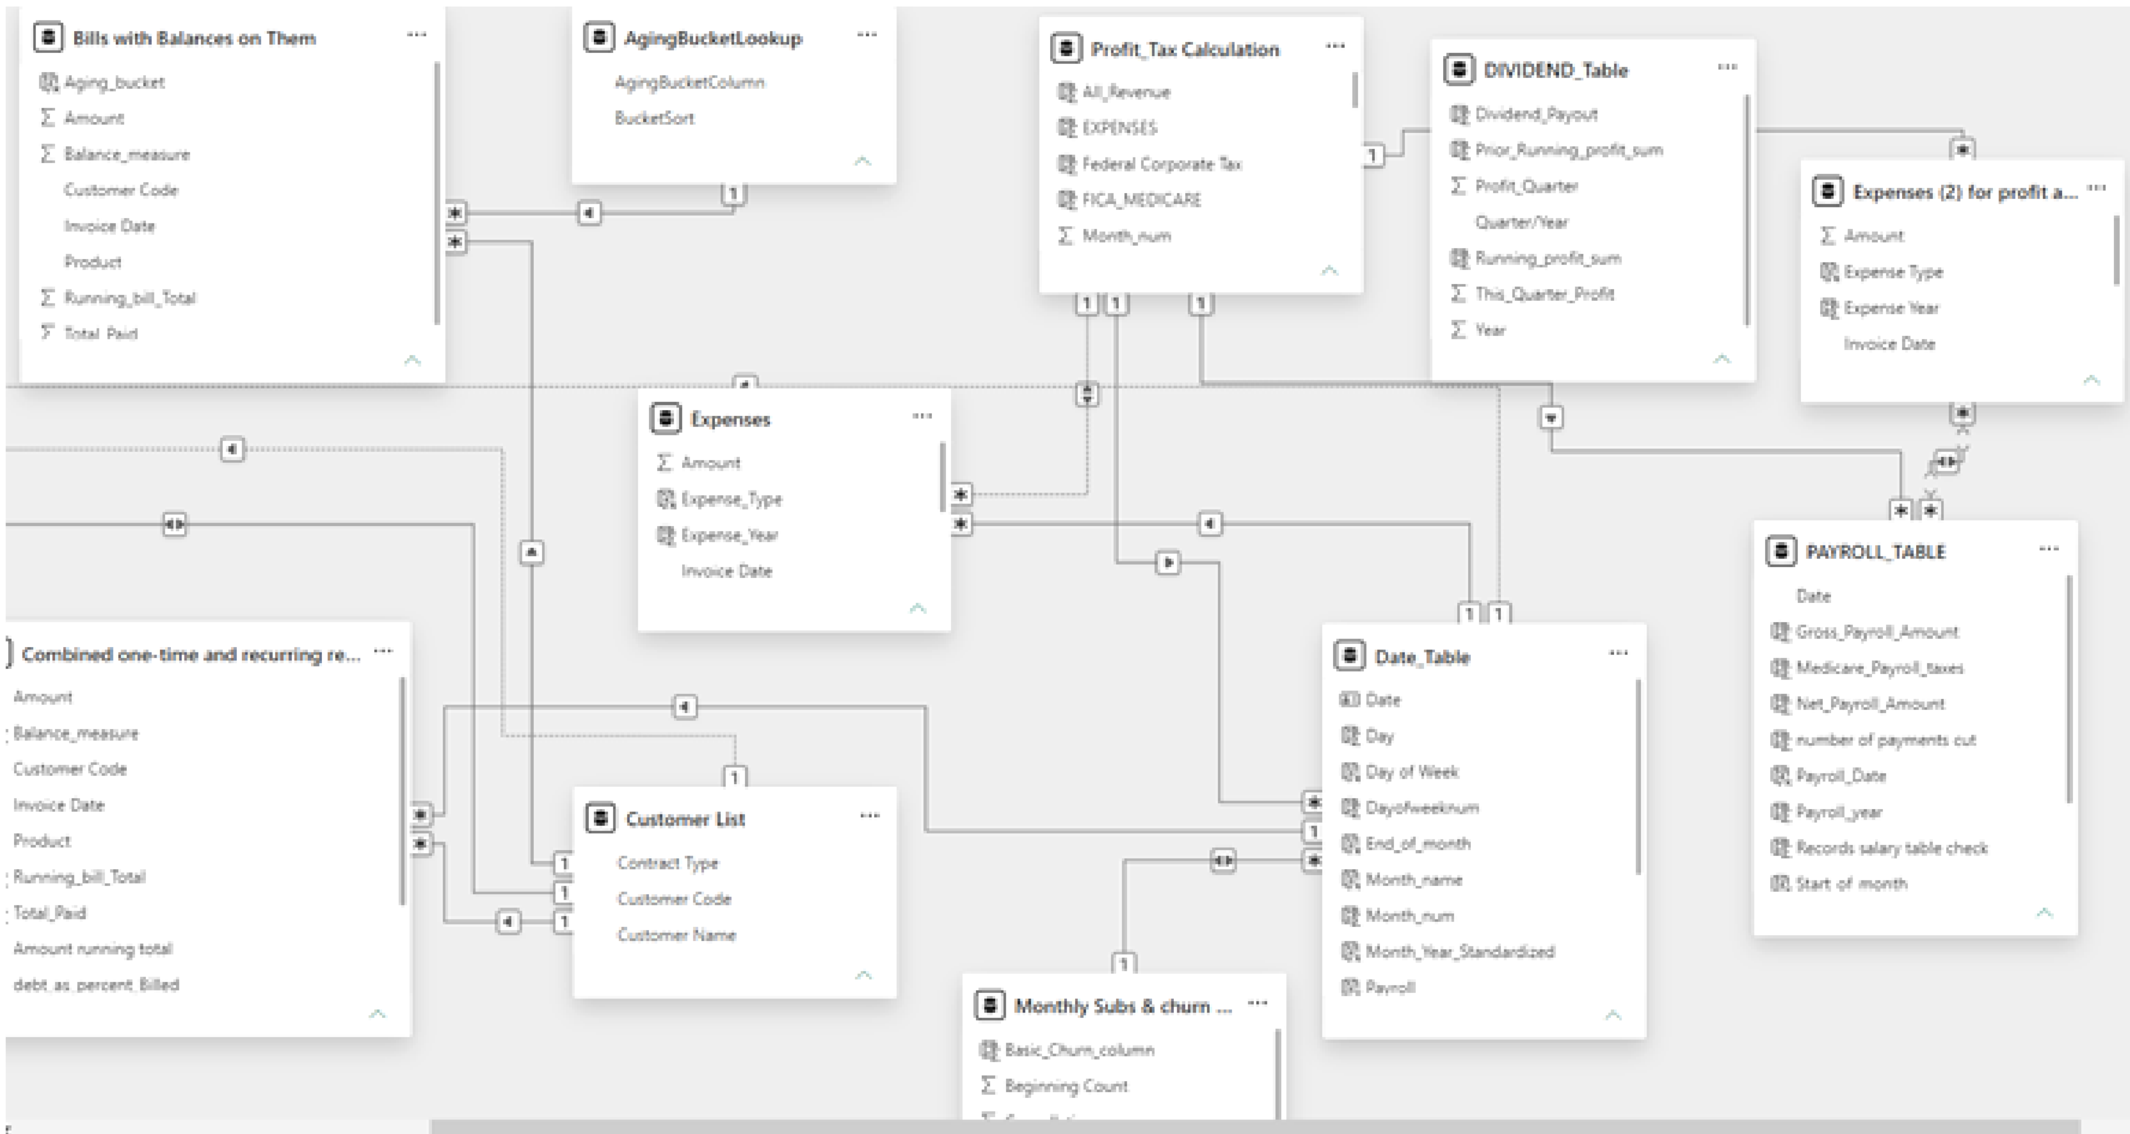
Snapshot of some of the Financial tables from the semantic model view. This model includes many data sources so there are a few other tabs in the Model view



DAX snapshot #1:

- Using a list of bills with debt to isolate ones with balances, then assigning them aging buckets
- ***this made many reference and calculated tables so is messy and I would definitely do this in SQL to take advantage of the LAG function (to base math off of prior rows) in real life, this is just for illustrative purposes as a work sample***

```
Bills with Balances on Them =
FILTER('Combined one-time and recurring revenue',
VAR Total_they_paid = CALCULATE(AVERAGE('Combined one-time and recurring revenue'[Total_Paid]),
ALLEXCEPT('Combined one-time and recurring revenue','Combined one-time and recurring revenue'[Customer Code]))
RETURN 'Combined one-time and recurring revenue'[Running_bill_Total] >= Total_they_paid)

```

```
Aging_bucket = SWITCH(TRUE(),'Bills with Balances on Them'[Invoice Date]>=(TODAY()-30),"0-30 Days",
            'Bills with Balances on Them'[Invoice Date]<(TODAY()-30) && 'Bills with Balances on Them'[Invoice Date]>=
            (TODAY()-60),"30-60 Days",
            'Bills with Balances on Them'[Invoice Date]<(TODAY()-60) && 'Bills with Balances on Them'[Invoice Date]>=
            (TODAY()-90),"60-90 Days",
            'Bills with Balances on Them'[Invoice Date]<(TODAY()-90) && 'Bills with Balances on Them'[Invoice Date]>=
            (TODAY()-120),"90-120 Days",
            'Bills with Balances on Them'[Invoice Date]<(TODAY()-120),"120+ Days"
            )
```

DAX snapshot #2:

- This is the background math to the income statement, summing up and summarizing information in multiple other tables.
- This shows that where data doesn't exist in a table, you can still turn it into one

```
Income_Statement =
UNION(
SUMMARIZE('Expenses (2) for profit and tax table relationship',
'Expenses (2) for profit and tax table relationship'[Expense Year],
'Expenses (2) for profit and tax table relationship'[Expense Type],
"Amount",-SUM('Expenses (2) for profit and tax table relationship'[Amount]))

,
    SUMMARIZE(
        'PAYROLL_TABLE',
        'PAYROLL_TABLE'[Payroll_year],
        "Payroll Type",         -- This defines the text string column name
        "Payroll",              -- This is the static text value assigned to that column
        "Amount",       -- This defines the amount column name
        -SUM('PAYROLL_TABLE'[Gross_Payroll_Amount]) -- Summarize requires an aggregation function for new columns
    ),

    SUMMARIZE('Monthly Subs & churn Data, Recurring Rev Pulled in',
    'Monthly Subs & churn Data, Recurring Rev Pulled in'[Year],
    "Revenue Type",
    "Revenue",
    "Income",
    sum('Monthly Subs & churn Data, Recurring Rev Pulled in'[Total_Revenue_ALL_Sources])),

    SUMMARIZE('DIVIDEND_Table',
    DIVIDEND_Table[Year],
    "Expense Type",
    "Dividends",
    "Amount",
    -sum('DIVIDEND_Table'[Dividend_Payout])),

```

DAX snapshot #3:

- To make a waterfall of more abstract trends, such as phases of a business:
- Make a reference table with a numeric field,
- Do math off of said numeric field

order	Category
1	Initial_Investment
2	Setup_costs
3	Contract Revenue
4	Expenses
5	Employees/Salaries
6	Monthly PrePaid Subcriptions
7	Taxes
8	Dividends

```
waterfall_math =
SWITCH(SELECTEDVALUE('Waterfall aggs'[Category]),"Initial_Investment",sum('Initial_investment & Setup Costs'
[Initial_investment]),"Setup_costs",sum('Initial_investment & Setup Costs'[Setup_Cost_Before_First_Client]),
"Expenses",(sum(Expenses[Amount])*-1)+(sum('Profit_Tax Calculation'[Federal Corporate Tax])*-1)+(Sum('Profit_Tax
Calculation'[State_Tax])*-1),"Employees/Salaries",sum(PAYROLL_TABLE[Gross_Payroll_Amount])*-1,
"Contract Revenue",sum('Recurring Revenue'[Amount]),
"Monthly PrePaid Subcriptions",sum('Monthly Subs & churn Data, Recurring Rev Pulled in'[Subscription_Revenue]),
"Taxes",(sum('Profit_Tax Calculation'[Federal Corporate Tax])+sum('Profit_Tax Calculation'[State_Tax]))*-1,
"Dividends",-1*SUM(DIVIDEND_Table[Dividend_Payout])
,BLANK())
```
