Trading RSI and Morning Moves on Select Stocks

- This report provides a snapshot of potential stock trades aimed to take advantage of the many V-shaped moves in the stock market
- I documented > 1800 trades so far, between April 2025 and today
- Since I did some of these trades in real life, you may notice a focus: cheaper low-PE dividend-paying “boomer” stocks. I was not comfortable tracking or trading tech stocks or the market as a whole, since they/it have generally been overvalued and too reliant on a few stocks (NVDA and APPL). Concentration risk is too high there
- Two strategies: buy the “morning move” – most stocks rally first thing, then drop hard between 10AM - 10:30AM, then recover. Trick is to time the bottom
- Trade RSI or relative strength index. This measures the % of recent time periods when the stock is falling. I usually use 1-minute RSI, sometimes 5-minute RSI. Even in crashes, stocks often hit a low RSI (<30) and then have temporary relief rallies. It’s often a sign that things are getting sold too hard and fast, and that the selling is going to take a break
- RSI trades are less predictable, especially when volume is low

Ideal Morning Move (ex. MCD on 6/16/2026)

Ideal RSI Trade (PG stock, 6/10/2026). Sharp Dip then Recovery

Potential Morning Move Profitability X Stock X Sector

De-comp of Potential RSI Trades

also split by a subjective tag "value" or not. Ex. "value" = utility trading at 18X earnings. Not value = MSFT at 35 PE

Most Profitable RSI Trade Tickers

Symbol	# of opportunities	Average Profit
BX	31	\$158
KR	16	\$249

MCD	69
PG	134
SPY	120
TLT	118

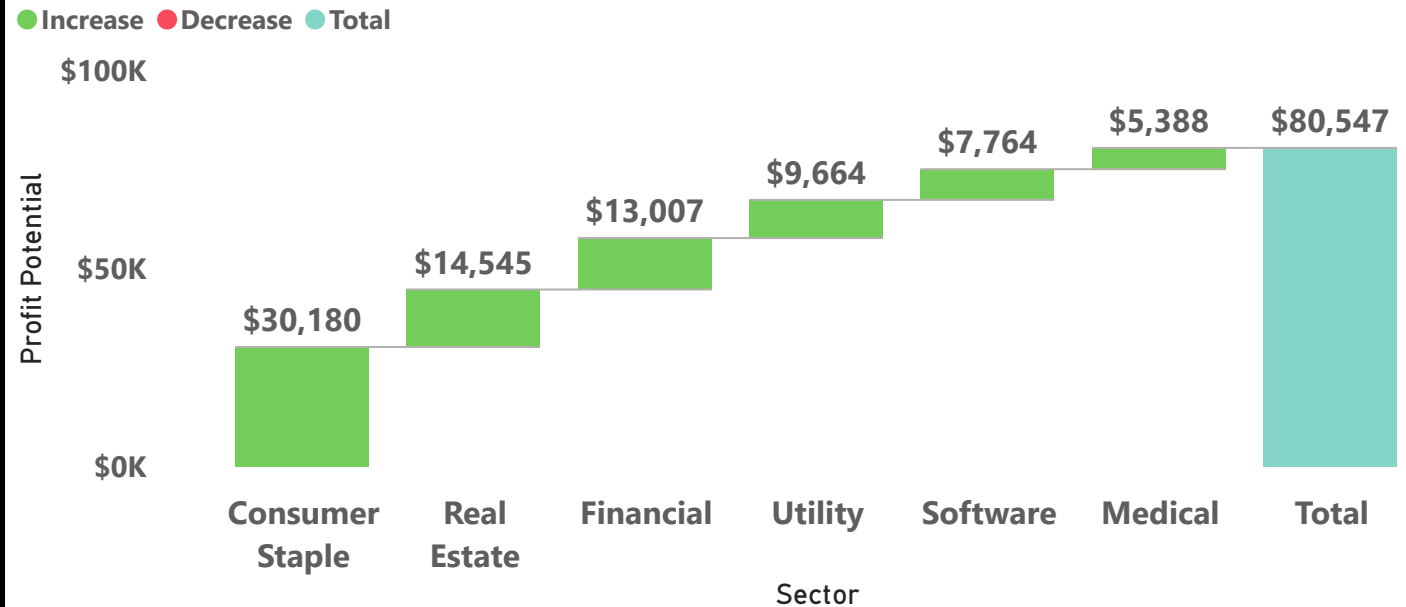

Here is some more granularity on how potential profits look over time and why it's not easy to always make \$\$\$\$. These are the stocks with the most opportunity. Notice the random large losses. It can be hard to step back in and start trading the same stocks after documenting a loss like these (let alone taking the loss)

\$257	\$232	WHR	DVN	

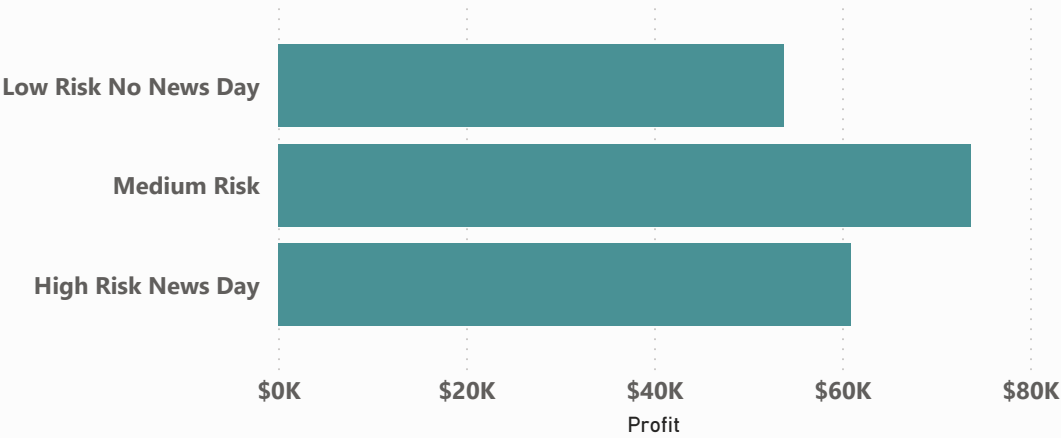

Definitions:

- High Risk Day = war news came out overnight, Fed Reserve meeting, inflation report in the morning, BLS report release, etc.
- Medium Risk = ex. big tech earnings but no real good/bad news
- Low Risk = No news

Findings:

- Medium-risk days are the worse for general RSI-strategy profitability
- High Risk days will give you the same overall profitability as low risk days, BUT give you the largest losses AND gains. So it's a question if you can stomach more trades if your first trade is a loss
